# Introduction

- Jose Meseguer: “I strongly conjecture that there is a deep connection between **matching logic** and the **constrained constructor patterns**. It would be great to better understand the details of such a connection.”
- A constrained constructor pattern is a pair  $u \mid \varphi$  consisting of
  - a constructor term  $u$
  - a constraint  $\varphi$  (quantifier-free FOL formula)
- A matching logic unifies the FOL syntax of formulas and terms, allowing us to build formulas called **patterns** that are matched by elements.
  - E.g.,  $\varphi_1 \wedge \varphi_2$  is matched by those matching  $\varphi_1$  and  $\varphi_2$ .
- **Main idea:**  
**Constrained constructor pattern  $u \mid \varphi$  is the same as the pattern  $u \wedge \varphi$ .**

# Challenges and Contributions

- How to define the OS spec  $(\Sigma, E \cup B)$  using a matching logic theory?
- How to capture the canonical term model of the OS spec?
- Is  $u \mid \varphi$  the same as matching logic pattern  $u \wedge \varphi$ ? To what extends?
  - Semantically,  $\|u \mid \varphi\| = \exists \vec{x}. (u \wedge \varphi)$  is the set of terms  $u$  where  $\varphi$  holds.
- This semantic equivalence reduces properties of constrained constructor patterns into matching logic theorems and/or meta-theorems.

# Challenges and Contributions

- Studying the relation between constrained constructor patterns and matching logic has a mutual benefit:
  - Matching logic can benefit from borrowing the computationally efficient reasoning modulo axioms.
  - The theory of constrained constructor patterns can get more expressiveness from its formalization in matching logic.
- We use an example (Sieve of Eratosthenes) to present matching logic and its connection with constrained patterns in an intuitive way.

# An Example: Sieve of Eratosthenes

In **constrained constructor patterns**:

- configurations:  $\text{cfg}(l_1, l_2) \mid \text{primes?}(l_1) \wedge \text{sorted?}(l_2) \wedge \text{lt?}(l_1, l_2)$
- transition:  $\text{cfg}(l_1, \text{cons}(k, l_2)) \Rightarrow \text{cfg}(\text{cons}(k, l_1), \text{removeMult}(l_2, k))$
- sorts and subsorting:  $\text{Int}, \text{List}$
- constructors:  $\text{nil}, \text{cons}$
- defined functions/predicates:  $\text{removeMult}, \text{primes?}, \text{sorted?}, \text{lt?},$
- subsumption (for rewriting, defined at the meta-level)  
$$\|\text{cfg}(l_1, l_2) \mid \text{primes?}(l_1) \wedge \text{sorted?}(l_2) \wedge \text{lt?}(l_1, l_2) \wedge l_2 \neq \text{nil}\|$$
$$\subseteq \|\text{cfg}(l_1, \text{cons}(k, l_2))\|$$
- unification/conjunction (for narrowing, defined at the meta-level)  
$$\|\text{cfg}(l_1, l_2) \mid \text{primes?}(l_1) \wedge \text{sorted?}(l_2) \wedge \text{lt?}(l_1, l_2)\|$$
$$\cap \|\text{cfg}(l_1, \text{cons}(k, l_2))\|$$

# An Example: Sieve of Eratosthenes

In **matching logic**:

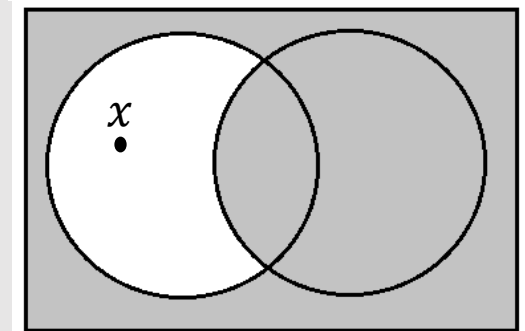

- Formulas are called patterns
- **A pattern is matched by a set of elements.**
- Conjunction=Intersection, Disjunction=Union, Negation=Complement, etc.
- Definedness (matched by at least one element) and totality (matched by all elements):
  - $[\varphi]$  is total iff  $\varphi$  is defined; otherwise, it is empty.
  - $[\varphi]$  is total iff  $\varphi$  is total; otherwise, it is empty.
- Membership and inclusion are expressed by patterns:
  - $x \in \varphi \equiv [x \wedge \varphi]$
  - $\varphi_1 \subseteq \varphi_2 \equiv [\varphi_1 \rightarrow \varphi_2]$

$$\varphi_1 \wedge \varphi_2$$

$$\varphi_1 \vee \varphi_2$$

$$\varphi_1 \rightarrow \varphi_2$$

# An Example: Sieve of Eratosthenes

- Sorts are (matching logic) symbols satisfying proper axioms:
  - $Int \in Sort, List \in Sort$
  - $x: Int \equiv x \wedge (x \in \llbracket Int \rrbracket)$
- Functions/predicates are symbols satisfying proper axioms:
  - $\exists l. nil = l$
  - $\forall n: Int. l': List. \exists l. conc(n, l') = l$
- Constructors: “no-junk no-confusion”.
  - $\llbracket List \rrbracket = \mu L. nil \vee \exists n: Int. \exists l: List . cons(n, l)$  “inductive principle”
  - $cons(n_1, l_1) = cons(n_2, l_2) \rightarrow n_1 = n_2 \wedge l_1 = l_2$
- Constrained constructor pattern  $\llbracket u \mid \varphi \rrbracket \equiv \exists \vec{x}. (u \wedge \varphi)$
- Subsumption expressed by a pattern:
$$\llbracket cfg(l_1, l_2) \mid primes?(l_1) \wedge sorted?(l_2) \wedge lt?(l_1, l_2) \wedge l_2 \neq nil \rrbracket$$
$$\subseteq \llbracket cfg(l_1, cons(k, l_2)) \rrbracket$$

# Quick Overview: Constrained Constructor Patterns

- An order-sorted signature  $\Sigma = (S, \leq, F)$ , where  $F = \Omega \cup \Delta$ .
  - $\Omega$ : the set of constructors.
  - $\Delta$ : the set of defined functions.
- An order-sorted (equational) theory  $(\Sigma, B \cup E)$ .
  - $B$ : the set of basic axioms like associativity, commutativity, etc.
  - $E$ : the set of other axioms, often oriented as rewrite rules, written  $\vec{E}$ .
- $u \mid \varphi$ , where  $u \in T_{\Omega}(X)$  is a constructor (with variables in  $X$ ).
- $\|u \mid \varphi\| = \{canf(u\rho) \mid \rho: X \rightarrow T_{\Omega}, C_{\Sigma/E, B} \models \varphi\rho\}$

# Constrained Constructor Patterns

$t \mid \phi$

$t_1 \mid \phi_1 \wedge t_2 \mid \phi_2$

# Matching Logic Patterns

- Matching logic signature  $\Sigma$  is a set of symbols.
- Matching logic patterns:
  - $\varphi ::= \sigma \in \Sigma \mid x \mid X \mid \varphi_1\varphi_2 \mid \perp \mid \varphi_1 \rightarrow \varphi_2 \mid \exists x. \varphi \mid \mu X. \varphi$
  - $x$ : element variable ranging over elements (like FOL variables).
  - $X$ : set variable ranging over sets (like propositional variables in modal logic).
  - $\varphi_1\varphi_2$ : application (left associative).
  - $\perp$  and  $\varphi_1 \rightarrow \varphi_2$ : propositional connectives (others can be derived).
  - $\exists x. \varphi$ : FOL-quantification.
  - $\mu X. \varphi$ : least fixpoint (like in modal  $\mu$ -calculus).
- Example:  $\exists x. \text{cons}(x, \text{cons}(x, l))$

# Matching Logic Pattern Semantics

- Matching logic has a **pattern matching semantics**.
- $\llbracket \varphi \rrbracket$  is the set of elements that **match**  $\varphi$ .
- Symbol interpretation  $\sigma_M \subseteq M$ .
- Application interpretation  $app_M: M \times M \rightarrow \mathcal{P}(M)$
- Given valuation  $\rho$  with  $\rho(x) \in M$  and  $\rho(M) \subseteq M$ :
  - $\llbracket x \rrbracket_\rho = \{\rho(x)\}$
  - $\llbracket X \rrbracket_\rho = \rho(X)$
  - $\llbracket \sigma \rrbracket_\rho = \sigma_M \subseteq M$
  - $\llbracket \varphi_1 \varphi_2 \rrbracket_\rho = \bigcup_{a_1 \in \llbracket \varphi_1 \rrbracket_\rho, a_2 \in \llbracket \varphi_2 \rrbracket_\rho} app_M(a_1, a_2)$
  - $\llbracket \perp \rrbracket_\rho = \emptyset$
  - $\llbracket \varphi_1 \rightarrow \varphi_2 \rrbracket_\rho = M \setminus (\llbracket \varphi_1 \rrbracket_\rho \setminus \llbracket \varphi_2 \rrbracket_\rho)$
  - $\llbracket \exists x. \varphi \rrbracket_\rho = \bigcup_{a \in M} \llbracket \varphi \rrbracket_{\rho[a/x]}$
  - $\llbracket \mu X. \varphi \rrbracket_\rho = \mathbf{lfp}(\lambda A \mapsto \llbracket \varphi \rrbracket_{\rho[A/X]})$

# Defining OSA in Matching Logic

	Order-Sorted Algebra	Matching Logic
Signature	$\Sigma = (S, \leq, F)$	$\Sigma^{\text{ML}} = \{[-], \llbracket - \rrbracket, \text{Sort}\} \cup S \cup F$
Axioms	OSA metalanguage	ML axioms
	$s \in S$	$s \in \text{Sort}$ $\exists y. s = y$ $\llbracket s \rrbracket \neq \perp$
	$s \leq s'$	$\llbracket s \rrbracket \subseteq \llbracket s' \rrbracket$
	$f \in F_{s_1 \dots s_n, s}$	$f : s_1 \times \dots \times s_n \rightarrow s$
	$x:s$ (sorted variable)	$x \in \llbracket s \rrbracket$
Terms	$t$	$t^{\text{ML}}$
	$f(t_1, \dots, t_n)$	$f t_1 \dots t_n$
Sentences	$\varphi$	$\varphi^{\text{ML}}$
	$\{x_1, \dots, x_n\} = \text{variables in } \varphi$	$x_1 \in \llbracket s_1 \rrbracket \wedge \dots \wedge x_n \in \llbracket s_n \rrbracket \rightarrow (\varphi = \top)$
Model	$A$	$M \equiv A^{\text{ML}}$
	$f_A : A_{s_1} \times \dots \times A_{s_n} \rightarrow A_s$ $f_A(a_1, \dots, a_n)$	$f_M a_1 \dots a_n = \{f_A(a_1, \dots, a_n)\}$

**Fig. 1.** Given an order-sorted signature  $\Sigma = (S, \leq, F)$  and a  $\Sigma$ -OSA  $A$ , we derive a ML signature  $\Sigma^{\text{ML}}$  and a corresponding  $\Sigma^{\text{ML}}$ -model  $M \equiv A^{\text{ML}}$ .

# Constrained Constructor Pattern Subsumption: A Matching Logic View

- Question: Whether  $\llbracket u \mid \varphi \rrbracket \subseteq \bigcup_{i \in I} \llbracket v_i \mid \psi_i \rrbracket$ ?
- The answer is given by  $(E_\Omega \cup B_\Omega)$ -matching:
- $C_{\Sigma, B, E} \models \varphi \rightarrow \bigvee_{(i, \beta) \in \text{MATCH}(u, \{v_i \mid i \in I\})} \psi_i \beta$
- We can put the above result as an internal theorem in matching logic.

**Theorem 2.** *The following holds:*

$$C_{\Sigma/E, B}^{\text{ML}} \models (\exists \bar{x} : \bar{s}. u^{\text{ML}} \wedge \varphi^{\text{ML}}) \subseteq \left( \bigvee_{i \in I} \exists \bar{y}_i : \bar{s}_i. v_i^{\text{ML}} \wedge \psi_i^{\text{ML}} \right) \leftrightarrow$$

$$\left( \varphi^{\text{ML}} \rightarrow \bigvee_{(i, \beta) \in \text{MATCH}(u, \{v_i \mid i \in I\})} (\psi_i^{\text{ML}} \wedge \beta^{\text{ML}}) \right)$$

# Conclusion

- We establish the relationship between two approaches that formalize state predicates of distributed systems:
  - constrained constructor patterns
  - matching logic
- There is a mutual benefit:
  - Matching logic can benefit from borrowing the computationally efficient reasoning modulo axioms.
  - The theory of constrained constructor patterns can get more expressiveness from its formalization as a fragment of matching logic.
