

My teaching goal is to help students become active and independent life-long learners. Toward this goal, I have endeavored to create an interactive and inclusive environment in my teaching and outreach.

**Teaching Experience.** From 2014 to 2015, I worked as an assistant lecturer at Birmingham City University (BCU) for two undergraduate courses, Data Analysis and Software Engineering. During that time, I attended the BCU training program Preparing Postgraduate Researchers to Teach and obtained a teaching certificate accredited by the Staff and Educational Development Association in the U.K. In 2016, I joined the University of Illinois Urbana-Champaign. During my graduate studies, I worked as a teaching assistant (TA) for CS427 Software Engineering (I) in the Fall 2019 and Fall 2020 semesters. The course had around 100 students in 2019 and 190 students in 2020. It covered basic concepts of software engineering practices, environments, and processes. My duties included reviewing and grading students' assignments, preparing and maintaining materials on the course website, hosting weekly office hours, providing hands-on assistance, and supervising students on their final team projects. I served as the lead TA in 2020 and was responsible for hosting weekly TA meetings, coordinating with the instructor to assist in daily teaching plans, and monitoring administration-related questions. Besides, I gave guest lectures in CS422 Programming Language Design, CS522 Programming Languages Semantics, and CS598 Runtime Verification on various topics in category theory, functional programming, runtime verification, and my Ph.D. research.

I am eager to use **learner-centered teaching methods** [1] and **active learning** techniques to help my students become independent learners. For example, when I supervised students' team projects in CS427 Software Engineering (I), I let students themselves propose use cases to be implemented for the projects, develop timelines, set weekly goals, and allocate teamwork. Instead of a lecturer, I played the role of a facilitator who participated in the discussion and provided only guidance, not direct answers. Sometimes, a team could be too ambitious and propose too many use cases. Instead of directly telling the group that the proposal was too big, I encouraged them to divide the workload and set weekly goals. After that, the students realized that the workload was too big and adjusted the proposal accordingly. I found this technique especially effective in supervising team projects because students viewed me not as an outsider but as their partner.

I have experience in **online teaching**. In the Fall 2020 semester, CS427 Software Engineering (I) was delivered entirely online for the first time, and the course structure was significantly changed. As the lead TA, I actively coordinated with the students, the instructor, and the other TAs to implement the new online course format. For example, the online course used an existing Coursera package with pre-recorded lecture videos, quizzes, and assignments. On the other hand, it still used the final projects and other reading materials in the face-to-face version. I helped merge the Coursera package and the face-to-face course into a cohesive and consistent one. I helped the instructor adjust the Coursera course agenda to fit the new schedule of the semester and added new Coursera pages that linked to the face-to-face materials. I helped upload office hours recordings, supervised students' projects on Slack, and monitored students' questions on Piazza and Salesforce.

I promote **education inclusion in hybrid flexible (HyFlex) teaching** [2][3] and ensure that remote students have an equally engaging experience as in-person students. For example, my guest lecture in CS522 Programming Languages Semantics was in a HyFlex format, with in-person and remote students. To create an engaging environment, I arrived at the classroom 10 minutes earlier to make small talk. It created a welcoming atmosphere, helped students to get to know me better, and allowed me to test the camera, the microphone, and slide sharing. In class, I made eye contact with students in the classroom and looked into the camera to make "virtual eye contact" with remote students. When I asked students whether they had questions, I said, "do we have any questions?"

and then, “do we have questions from chat?” to include remote students in the discussion. I repeated questions from the classroom so that remote students could hear them well.

**Mentoring Experience.** I have had the honor to serve, as a research mentor, two undergraduate students, three master’s students, and three Ph.D. students, from the U.S. and abroad. One undergraduate student published a top-tier conference paper with me, with another paper in the submission pipeline, and is now pursuing a Ph.D. at Carnegie Mellon University. One Master’s student recently graduated, and I served as the External Consultant for his thesis.

I dedicate my time and effort to building trust-based mentor-mentee relationships. On my busiest days, I spent 8 hours per week on mentoring. I hold one-on-one weekly meetings with each student to discuss research and use Slack for offline discussions. My general mentoring objective mirrors my teaching goal: I help students to take charge of their development and success. For concrete mentoring methods, I have been learning by reflecting on my personal experience as a mentee with my Ph.D. advisor and reading articles that offer guidance for mentors. For example, I borrow the idea of **demonstrations** from active learning strategies in my mentoring. I prefer to show students the best practices for conducting quality research through my actions. When I comment on a student’s draft paper, I give critical feedback and make concrete, implementable suggestions as comments in the PDF files. Although it takes me more time, it is a good learning experience for the student to merge and implement the feedback. It also gives them a sense of ownership of their paper and makes them feel valued for their dedication.

**Outreach.** For me, teaching is not limited to lecturing in a classroom but is a means to break knowledge barriers. I have consistently sought outreach opportunities to engage a larger audience. For example, I gave a 3.5-hour tutorial at ICFP 2020, a top-tier conference in functional programming, to participants from all over the world and taught them how to use the K framework, a tool to which I am one of the main contributors, to formalize functional programming languages. To engage the audience, I prepared demos and hands-on sessions and ran the tutorial with a mix of lecturing and discussion. A recording of the tutorial is available online ([https://www.youtube.com/watch?v=VlQMj\\_N42B8](https://www.youtube.com/watch?v=VlQMj_N42B8)) and has gathered more than 1000 views.

In the summer of 2022, I helped the startup Runtime Verification Inc. establish its new research arm, RV Research (<https://research.runtimeverification.com/>), and recorded videos on several open problems with practical impact to bridge the gap between academic research and industrial interest.

**Teaching Interest.** Based on my teaching and research experience, I am qualified and eager to teach undergrad and graduate courses on logic, formal methods, programming languages, and software engineering. Such courses will allow me to share my academic and industry experience in using formal methods to improve the safety and reliability of computing systems. Formal methods courses will allow me to explore semantics-first techniques and tools for building reliable software. Programming languages courses will let me discuss major language design paradigms as unifying themes based on my expertise in language semantics. Logic courses will allow me to give students the big picture of the use of logic in computer science, help them understand connections between logic and algorithms, and prepare them for using logic tools to solve problems.

Beyond teaching existing classes, I also like to create new courses that bring together traditional topics in programming languages and formal methods and new computing scenarios. For example, my research and industry experience make me an ideal candidate to teach a course on programming languages and blockchain, which will explore the design, implementation, and formal analysis support of programming languages through the lens of blockchain applications and smart contracts. I also look to organize seminars on programming languages and formal methods. Overall, I will help students at my institution to succeed in academia and industry.
